

The mathematical details: a supplement to the "learn classes module" on Github

René Ask, Kaspera Skovli Gåsvær & Maria Linea Horgen
(Dated: August 20, 2020)

This documents is just to give some mathematical background to the class implementation of the tutorial. The integral to be solved as part of the C++ class tutorial is

$$\int_0^1 e^{-x} dx = 1 - e^{-1}. \quad (1)$$

To thi end, we consider a general integral of a one-dimensional real function $f(x)$ which we solve by the trapezoidal rule given by the approximation,

$$\int_a^b f(x) dx \approx h \left[\frac{f(a) + f(b)}{2} + \sum_{j=1}^{n-1} f(x_j) \right], \quad (2)$$

where n is the number of points, $h = (b - a)/n$ is the step size, and a and b are the integration limits.
